

## Rain Water Tanks

To save water and to cut down on your water bills you can purchase a large rain tank. The rain tanks can be expensive to buy, depending on their size. I think the largest rain tanks are the best ones to buy, due to their large volume of water that they can hold. Below are some water tank sizes and prices:

- 25 gallon water tank price around \$58.00
- 305 gallon water tank price around \$221.00
- 10,000 gallon water tank price around \$5,300
- 15,000 gallon water tank price around \$14,700

If you cannot afford one of the larger water tanks, then using a couple of 25 gallon water tanks will still help the environment. Imagine if everyone just had one 25 gallon water tank in their backyard. This would save an amazing amount of water from being removed from our lakes and rivers every year.

**To install your water tank you will** need to attach a down pipe from your house gutter to the top of your water tank. I would advise you on paying a qualified Plumber to install the down pipe. In some countries it is illegal to do any type of plumbing work yourself.

Once your water tank has been installed you will need to keep the gutter of your house clear of all leaves. By you doing this it will make sure that the rain water will flow correctly along the roof gutter to your water tank. You also do not have to worry about your water tank standing out and becoming an ugly sight in your garden. There are plenty of designs out there that blends the water tanks into your gardens environment.
